- National Taiwan University College of Medicine, BS.

### Career and certification:

- Attending Physician, Department of Obstetrics & Gynecology, National Taiwan University Hospital Hsin-Chu Branch.
- Attending Physician, Department of Obstetrics & Gynecology, Ministry of Health and Welfare.
- Members, Taiwan Association of Gynecologic Oncologists.

### Reminder from Dr.:

High-risk human papillomavirus (hrHPV) is an established carcinogen in the cervix, penis, vulva, vagina, anus and oropharynx. The discovery of virus-like particles (VLPs) that are both highly immunogenic and protective led to the licensure of several prophylactic VLP-based HPV vaccines for the prevention of

cervical cancer. Vaccine-mediated, type-specific protection has been shown to be durable for at least a decade. Importantly, this protection was not absolutely type-specific because significant cross-protection. Vaccination did not eliminate the risk of cervical precancerous lesions or cervical cancer and are preventive not therapeutic. Therefore cervical screening is advised in vaccinated patients because of the potential for disease caused by hrHPVs other than those targeted by the licensed vaccines.
