Reminder from Dr. Hsu

Many parents feel confused about the best timing of orthodontic treatment for their little ones; they may concern about the children's underbite, or protruded incisors. The crainofacial growth modification for children in orthodontics, which means changing the skeletal relationship by means of orthodontic/ orthopedic traction, have considerations in many aspects such as age, potential of treatment effect, space evaluation and retention design. This means some of the children will benefit from early growth modification while others we might suggest them to wait until growth complete. If you have doubt in the children's best timing of orthodontic intervention, please make a doctor's appointment in orthodontic department.
