● Reminder from Dr. Yao

Chronic cough is the most common problem in thoracic outpatient clinics. Etiologies of chronic cough may range from post-infectious cough caused by common colds to severe lung disease such as lung cancer. If cough persists for more than three weeks, visiting thoracic outpatient clinics for further evaluation is strongly recommended.

In addition, our government provides free influenza vaccine for high-risk

groups in October every year. People who meet the criteria are advised to get vaccines for prevention of serious complications from influenza.
