• **Reminder from Dr. Lin**

For people living in modern society, work is the main economic source and an important way to gain a sense of accomplishment and

self-realization. Occupational injuries and diseases, if not managed correctly, could lead to permanent disability and difficulty in returning to work, which could adversely impact income, quality of life and mental health of workers. Labor dispute could also arise. Prevention is better than cure. We should pay attention to workplace safety and hygiene and identify potential occupational hazards. If you are a victim of occupational injury or disease, you could come to our department for evaluation and treatment, early occupational rehabilitation and early return to work.
