• **Reminder from Doctor Huang:**

Fever is the common presenting complaint in children and is defined as abnormal elevation of the body temperature with elevated hypothalamic set-point in response to a disease or illness. Various illnesses and

conditions can cause fever and they include infectious diseases (e.g., common cold, urinary tract infection, acute infectious diarrhea, pneumonia, meningitis, septic arthritis, etc.), autoimmune disorders, neoplasms, drug fever, inflammatory illnesses and others. The evaluation and management of febrile illnesses in children can be clinically challenging. Please keep contact with your doctor for further information.
