• **Reminder from Dr. Kang:**

Allergic diseases such as atopic dermatitis, allergic rhinitis, or asthma are common health problems in

children. Although predisposed genetic factors play a determinant role in the development of allergic diseases, there are still something that could be done for better adjustment: regular exercise, a balanced and healthy diet, adequate sleep , detection and avoidance of specific allergens, and so on. In addition, seeking timely medical advice and following the doctor's instructions for long-term control, can also reduce the frequency of severe symptoms, maintain a healthy state, and improve the quality of life.
