## Taiwan University Hospital.

### • **Reminder from Dr. Chen:**

Oral health is inextricably linked to overall health, yet many people neglect its importance, leading to a high prevalence of oral diseases. The teeth, mouth, and facial areas not only affect appearance and function but are also crucial to both psychological and physiological health. Oral and facial diseases, from cavities to jawbone tumors, often have no obvious symptoms in the early stages. By the time they are detected, they may have already worsened, requiring significant time and financial resources for treatment.

Therefore, prevention is better than cure, and regular oral health check-ups are essential. With

the advancement of modern medicine, dentistry is also moving towards precision and digitization, aiming to provide patients with the best possible medical care through technological assistance.
