- Adjunct Lecturer, College of Medicine, National Taiwan University.
- Chief resident, Department of Dermatology, National Taiwan University Hospital.

• **Reminder from Dr. Huang:**

Atopic dermatitis is often associated with allergic rhinitis and asthma, forming the well-known

"atopic triad." The itchy, scaly rashes typically occur in flexural areas like the neck, elbows, and knees, and are often accompanied by dry skin, increased palm lines, and hyperpigmentation. Traditional treatment varies depending on the severity and includes moisturizers, topical anti-inflammatory agents, oral antipruritic medications, phototherapy, and oral immunomodulators. In recent years, newer treatment options such as biologics and small molecule oral immunomodulators (JAK inhibitors) have also proven effective in relieving patients' discomfort.
